Received September 23, 2019; Revised November 22, 2019; Accepted November 25, 2019

Abstract In this article, the nonlinear partial fractional differential equation, namely the KdV equation is renewed with the help of modified Riemann- Liouville fractional derivative. The equation is transformed into the nonlinear ordinary differential equation by using the fractional complex transformation. The goal of this paper is to construct new analytical solutions of the space and time fractional nonlinear KdV equation through the extended $(G'/G)$-expansion method. The work produces abundant exact solutions in terms of hyperbolic, trigonometric, rational, exponential, and complex forms, which are new and more general than existing results in literature. The newly generated solutions show that the executed method is a well-organized and competent mathematical tool to investigate a class of nonlinear evolution fractional order equations.

Keywords Complex Transformation, Modified Riemann-Liouville Derivative, New Extended $(G'/G)$-Expansion Method, Nonlinear Auxiliary Equation, Travelling Wave Solutions

1. Introduction

The application of fractional order differential equations is a matter of recent decades but the theory of fractional calculus has quite a long and prominent history. During the last three decades, fractional calculus has been applied to almost every field of science, namely mathematics, engineering and technology. Many important phenomena in turbulence, fluid dynamics, stochastic dynamical system, plasma physics, controlled thermonuclear fusion, non-linear control theory, image processing, non-linear biological systems, and astrophysics are well described by the fractional differential equations (FDEs) [1-7]. Therefore, one of the fundamental problems for these models is to engender traveling wave solutions for nonlinear FDEs (NFLDEs). In the literature various numerical and analytical methods have been developed such as the domain decomposition method [8], the differential transform method [9], the homotopy perturbation method [10], the first integral method [11], the fractional sub-equation method [12], the exp-function method [13,14], the $(G'/G)$-expansion method [15-25] and so on.

As every nonlinear equation has its substantially noteworthy rich structure, still, significant research has to be done due to be well established the $(G'/G)$-expansion method. It is important to present various new methods to construct many new exact solutions of FDEs. In this article, we would like to implement the new extended $(G'/G)$-expansion method with the help of modified Riemann Liouville derivative by Jumarie [26-28] to solve nonlinear space and time fractional KdV equation.

Let $f : R \rightarrow R, x \rightarrow f(x)$, be a continuous (but differentiable is not compulsory) function. The Jumarie’s modified Riemann Liouville derivative of order $\alpha$ is as follows:

$$D^\alpha f(x) = \begin{cases} \frac{1}{\Gamma(-\alpha)} \int_0^x (x-\xi)^{-\alpha-1} (f(\xi)-f(0))d\xi, & \alpha < 0 \\ \frac{1}{\Gamma(1-\alpha)} \frac{d}{dx} \left[(x-\xi)^{\alpha} (f(\xi)-f(0))d\xi, & 0 < \alpha < 1 \\ \right] \\ \left[(f^{(n)}(x))^{\alpha}\right], & n \leq \alpha < n+1, n \geq 1 \end{cases}$$

We can have some important properties for the
modified Riemann-Liouville derivatives are as [29]:

\[ D^\alpha_x x^r = \frac{\Gamma(1+r)}{\Gamma(1+r-\alpha)} x^{-\alpha}, r > 0 \]  

\[ D^\alpha (f(x)g(x)) = g(x)D^\alpha f(x) + f(x)D^\alpha g(x), \]  

\[ D^\alpha u[f(x)] = u'(f)D^\alpha f(x) = D^\alpha u(f)(f'), \]  

where \( \Gamma \) denotes the Gamma function.

### 2. Illustration of the New Generalized \((G'/G)\)-Expansion Method for Fractional Partial Differential Equations

The main steps of the suggested method are discussed in this section.

Let us consider the NLFDE as:

\[ u(x,y,z,t) = u(x,y,t), \]  

where \( D^\alpha, D^\beta, D^\delta, \ldots \) are the modified Riemann-Liouville derivatives of \( u \), \( u = u(x,y,t) \) is an unknown function, and \( P \) is a polynomial of \( u \) and its various partial fractional derivatives in which the highest order derivatives and nonlinear terms are involved.

The most important algorithm of the method is presented below:

**Step 1.** First, we convert the Fractional differential equation into an ordinary differential equation (ODE) using a fractional complex transformation [30,31]. Now, we define the traveling wave variable

\[ \xi = \frac{K x^\beta}{(\beta + 1)} + \frac{N y^\gamma}{(\gamma + 1)} + \frac{M z^\delta}{(\delta + 1)} + \frac{Lt^\alpha}{(\alpha + 1)}, \]  

where \( K, L, M, N \) are nonzero arbitrary constants. Then we can rewrite Eq. (5) into an ODE of \( u = u(\xi) \) in the form:

\[ Q(u,u',u'',u''',\ldots) = 0. \]  

Where \( Q \) is a polynomial of \( u \) and primes denote the derivative with respect to \( \xi \).

If possible, we can integrate Eq. (7) one or more times to get the outputs, where the constant of integration can be assumed to be zero for simplicity.

**Step 2.** Suppose that the travelling wave solution of Eq. (7) can be expressed as follows:

\[ u(\xi) = \sum_{j=0}^{m} a_j \psi(\xi)^j + \sum_{j=1}^{n} b_j \varphi(\xi)^{-j}, \]  

where \( \psi(\xi) = [d + \varphi(\xi)] \) and \( \varphi(\xi) \) is given by

\[ \varphi(\xi) = (G'(\xi)/G(\xi)). \]  

Here \( a_j \)’s and \( b_j \)’s and \( d \) are unknown constants to be determined later and \( G = G(\xi) \) satisfies the following auxiliary second order nonlinear ordinary differential equation (NLODE):

\[ A G'' + B G' - C G - E G^2 = 0, \]  

where \( A, B, C \) and \( E \) are real parameters.

**Step 4.** To determine the positive integer \( m \) appearing in Eq. (8), we take the homogeneous balance between the highest order nonlinear term and the highest order derivative in Eq. (7).

**Step 5.** Substituting Eq. (8) and Eq. (10) along with Eq. (9) into Eq. (7) with the value of \( m \) obtained in Step 4, we obtain polynomials in \( (d + \varphi(\xi))^m \) \((m = 0,1,2,\ldots)\) and \( (d + \varphi(\xi))^{-m} \) \((m = 1,2,3,\ldots)\). Then, setting each coefficient of the resulted polynomials to zero, a system of algebraic equations for \( a_j (j = 0,1,2,\ldots,m) \), \( b_j (j = 1,2,\ldots,m) \), \( K, L, M, N \) and \( d \) can be obtained.

**Step 6.** Suppose that the value of the constants can be found by solving the algebraic equations which are obtained in step 5. Substituting the values of \( a_j (j = 0,1,2,\ldots,m) \), \( b_j (j = 1,2,\ldots,m) \), \( K, L, M, N \), \( d \) and the general solution of Eq. (10) into Eq. (8), we can obtain a variety of exact travelling wave solutions of Eq. (5).

**Step 7.** The general solutions of Eq. (10) are as follows [22]:

**Family 1.** When \( B \neq 0, \lambda = A - C \) and \( \Omega = B^2 + 4E(A - C) > 0, \)

\[ \varphi(\xi) = \left(\frac{G'}{G}\right) = \frac{B}{2\lambda} + \frac{C_1 \sinh\left(\frac{\sqrt{2\lambda}}{2\lambda} \xi\right) + C_2 \cosh\left(\frac{\sqrt{2\lambda}}{2\lambda} \xi\right)}{C_1 \cosh\left(\frac{\sqrt{2\lambda}}{2\lambda} \xi\right) + C_2 \sinh\left(\frac{\sqrt{2\lambda}}{2\lambda} \xi\right)}. \]

**Family 2.** When \( B \neq 0, \lambda = A - C \) and \( \Omega = B^2 + 4E(A - C) < 0, \)
\[\varphi(\xi) = \left(\frac{G'}{G}\right) = \frac{B}{2\lambda} + \frac{\sqrt{\Omega}}{2\lambda} - C_s \sin \left(\frac{\sqrt{\Omega}}{2\lambda} \xi\right) + C_c \cos \left(\frac{\sqrt{\Omega}}{2\lambda} \xi\right), \quad (12)\]

**Family 3.** When \(B \neq 0, \lambda = A - C\) and \(\Omega = B^2 + 4E(A - C) = 0\),

\[\varphi(\xi) = \left(\frac{G'}{G}\right) = \frac{B}{2\lambda} + \frac{C_s}{C_c + C_s} \xi. \quad (13)\]

**Family 4.** When \(B = 0, \lambda = A - C\) and \(\Delta = \lambda E > 0\),

\[\varphi(\xi) = \left(\frac{G'}{G}\right) = \frac{\sqrt{\Delta}}{\lambda} C_s \sinh \left(\frac{\sqrt{\Delta}}{\lambda} \xi\right) + C_c \cosh \left(\frac{\sqrt{\Delta}}{\lambda} \xi\right) + C_s \sin \left(\frac{\sqrt{\Delta}}{\lambda} \xi\right), \quad (14)\]

**Family 5.** \(B = 0, \lambda = A - C\) and \(\Delta = \lambda E < 0\),

\[\varphi(\xi) = \left(\frac{G'}{G}\right) = \frac{\sqrt{\Delta}}{\lambda} C_s \sin \left(\frac{\sqrt{\Delta}}{\lambda} \xi\right) + C_c \cos \left(\frac{\sqrt{\Delta}}{\lambda} \xi\right) + C_s \sin \left(\frac{\sqrt{\Delta}}{\lambda} \xi\right), \quad (15)\]

### 3. Application of the Method

The Korteweg-de Vries (KdV) equation is executed as a model to disclose a wide-range of physical phenomena for the enlargement and communication of nonlinear waves. Firstly, this equation was derived as an evolution equation with small amplitude, and long surface gravity waves propagation in shallow water channel [32]. Consequently, the KdV equation is present in various other physical contexts as collision-free hydromagnetic waves, stratified internal waves, ion-acoustic waves, particle acoustic waves, plasma physics, lattice dynamics and so on [33–36]. It is used as a model for solitons, turbulence, shock wave formation, boundary layer behavior and mass transport in fluid dynamics, and continuum mechanics [35,36]. Due to significant applications of non-integer order of the KdV equation it is required to be investigated for space and time fractional KdV equation. For example, the nonlinear oscillation of an earthquake could be modeled of the fractional derivatives [37].

Let the nonlinear KdV equation with space and time fractional derivatives [37]:

\[\frac{\partial^\alpha u}{\partial t^\alpha} + au \frac{\partial^\beta u}{\partial x^\beta} + \frac{\partial^{3\beta} u}{\partial x^{3\beta}} = 0, \quad t > 0, \quad 0 < \alpha, \beta \leq 1 \quad (16)\]

With the help of the fractional complex transformation

\[u(x,t) = u(\xi), \quad \xi = \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)}, \quad \text{where} \quad K \text{ and } L \text{ constants, an ODE is obtained, which is on integrating twice, we obtain the following equation:}

\[\frac{1}{2} Lu^2 + \frac{a}{6} Ku^3 + \frac{K^3}{2} (u')^2 + P_1 u + P_2 = 0, \quad (17)\]

where \(P_1\) and \(P_2\) are integrating constants. Considering the homogeneous balance between the nonlinear term and the highest order derivative in Eq. (17), we have

\[u(\xi) = a_0 + a_1 \psi(\xi) + a_2 \left[\psi(\xi)^2\right]^2 + b_1 \left[\psi(\xi)^2\right] + b_2 \left[\psi(\xi)^2\right]^2, \quad (18)\]

where \(\psi(\xi) = [d + \varphi(\xi)], \quad \varphi(\xi) = G'(\xi) / G(\xi)\).

And \(a_0, a_1, a_2, b_1, b_2\) are constants to be evaluated later.

Using Eq. (18) along with Eq. (10) into Eq. (17), the left hand side results a polynomial in \((d + \varphi(\xi))^m, (m = 0, 1, 2, \ldots)\) and \((d + \varphi(\xi))^m, (m = 1, 2, 3, \ldots)\). Taking each coefficient of these polynomials and setting them to zero, we have a set of algebraic equations (for simplicity the equations have not been displayed here) for \(a_0, a_1, a_2, b_1, b_2, d, K, L, M, N\). Solving such algebraic equations using the symbolic computation software, such as Maple, we obtain following:
Case 1

\[
L = -\frac{K}{A^2} \left(12K^2 d^2 \lambda^2 - 12K^2 Bd \lambda - 8K^2 E \lambda + a_0 a^2 A^2 + K^2 B^2 \right), \quad a_1 = \frac{12K^2}{a^2 A^2} \left(2d \lambda^2 + B \lambda \right),
\]

\[
d = d, \quad a_2 = -\frac{12K^2}{a^2 A^2}, \quad b_1 = 0, \quad b_2 = 0, \quad p_1 = \frac{K}{2a A^4} \left(F_1 + F_2 + F_3 + F_4 + F_5 + F_6 \right),
\]

\[
p_2 = -\frac{K}{6a^2 A^6} \left(S_1 + S_2 + S_3 + S_4 + S_5 + S_6 + S_7 + \ldots + S_{16} \right),
\]

where \( \lambda = A - C \), \( F_1 = 144K^4 d^4 \left(A^4 + C^4 \right) + a^2 a_0^2 A^4 + a_0 A^2 \left(16CE + 24C^2 d^2 - 48ACd^2 \right) \),

\[
F_2 = 576K^4 d^2 ACE \left(A - C \right) - 24K^4 B^2 E \left(A - C \right) - 96K^4 A^2 C^2 + 24a_0 dK^2 A^3 B,
\]

\[
F_3 = 2aa_0 K^2 A^2 B^2 - 864K^4 d^6 ABC \left(A - C \right) - 192dK^4 BE \left(A^2 - C^2 \right) - 336d^2 K^4 AB C^2,
\]

\[

\[ h_{13} = 1728d^6K^6 \left( A^6 + C^6 \right) + d^3K^6A^3B \left( 5616dAB + 2592B^2 + 5184d^2A^2 \right) + 432K^6A^2B^2E^2, \]

\[ h_{14} = 72aa_0K^4A^2B^2CE + 1728aa_0d^2K^4A^2CE \left( A - C \right) - 2592aa_0d^3K^4A^2BC \left( A - C \right) - 576aa_0dK^4A^4BE, \]

\[ h_{15} = 576aa_0d^3K^4A^3C^2E - 1008aa_0d^3K^4A^4B^2C - 864aa_0d^3K^4A^4BC^2 + 504aa_0d^2K^4A^3B^2C^2 - 72aa_0dK^4A^4B^2C - 36a^2a_0^2dK^4A^2BC, \]
Case 3

\[ L = \frac{-K}{A^2} \left( a_0 A^2 - 2K^2 B^2 - 8K^2 E(A - C) \right), \quad d = \frac{-B}{2(A - C)}, \quad a_1 = 0, \quad a_2 = \frac{-12K^2 (A - C)^2}{aa^2}, \]
\[ b_1 = 0, \quad b_2 = \frac{-3K^2 \left( 16E^2(A - C) + 8B^2E \right)}{4aa^2 (A - C)}, \quad \]
\[ p_1 = \frac{K}{2aa^2} \left( m_1 + m_2 \right), \quad p_2 = \frac{-K}{6aa^2 A^6} (n_1 + n_2 + n_3), \]

where \[ m_1 = a^2 A^4 - 16aa_0 K^2 A^2 E(A - C) - 96K^4 B^2 E(A - C), \]
\[ m_2 = 384K^2 ACE^2 - 192K^4 A^2 E^2 - 4aa_0 K^2 A^2 B^2 - 12K^4 B^4 - 192K^4 C^2 E^2, \]
\[ n_1 = a^3 A_0^6 - 24aa_0^2 K^2 A^2 E(A - C) - 576aa_0 K^4 A^2 E^2 (A - C)^2 - 6a^2 a_0 K^2 A^4 B^2, \]
\[ n_2 = 13824K^6 E^3(A - C)^3 - 288aa_0 K^4 A^2 B^2 E(A - C) - 36aa_0 K^4 A^2 B^4, \]
\[ n_3 = 10368K^6 B^2 E^2 (A - C)^2 - 2592K^6 B^4 E(A - C) + 216K^6 B^6. \]

Case 4

\[ L = \frac{-K}{A^2} \left( a_0 A - 8K^2 E(A - C) - 2K^2 B^2 \right), \quad a_1 = 0, \quad a_2 = 0, \quad b_1 = 0, \quad d = \frac{-B}{2(A - C)}, \]
\[ b_2 = \frac{-3K^2 \left( 16E(A - C)^2 + 8B^2E(A - C) + B^4 \right)}{4aa^2 (A - C)}, \]
\[ p_1 = \frac{K}{2aa^2} \left( 48K^4 E(A - C)^2 + 24K^4 B^2 E(A - C) - 16a_0 aK^2 A^2 E(A - C) + 3K^4 B^4 + a^2 a_0^2 A^4 - 4a_0 a K^2 A^2 B^2 \right), \]
\[ p_2 = \frac{-a_0 K}{6aa^2} \left( 144K^4 E(A - C)^3 + 72K^4 B^2 E(A - C) - 24a_0 aK^2 A^2 E(A - C) + 9K^4 B^4 + a^2 a_0^2 A^4 - 6a_0 a K^2 A^2 B^2 \right). \]

To derive the new solitary wave solutions through the hyperbolic functional form, substituting Eq. (19) into Eq. (18) along with Eq. (11), whenever \( C_1 = 0 \) but \( C_2 \neq 0 \), and \( C_2 = 0 \) but \( C_1 \neq 0 \), we have the following solutions:

\[ u_{11} (\xi) = a_0 + \frac{12K^2}{a A^2} \left( d^2 \lambda^2 + B \lambda + \frac{B^2}{4} - \frac{\Omega^2}{4} \coth^2 \left( \frac{\sqrt{\Omega}}{2\lambda} \xi \right) \right), \]
\[ u_{12} (\xi) = a_0 + \frac{12K^2}{a A^2} \left( d^2 \lambda^2 + B \lambda + \frac{B^2}{4} - \frac{\Omega^2}{4} \tanh^2 \left( \frac{\sqrt{\Omega}}{2\lambda} \xi \right) \right), \]

where \[ \xi = \frac{K x^\beta}{\Gamma(1 + \beta)} - \frac{K t^\alpha}{\Gamma(1 + \alpha)} \left( 12K^2 d^2 \lambda^2 + 12K^2 B \lambda - 8K^2 \lambda^2 + a_0 a A^2 + K^2 B^2 \right). \]

After surrogating the complex transformation, we can turn out the following traveling wave solutions:

\[ u_{111} (x,t) = a_0 + \frac{12K^2}{a A^2} \left( d^2 \lambda^2 + B \lambda + \frac{B^2}{4} - \frac{\Omega^2}{4} \coth^2 \left( \frac{\sqrt{\Omega}}{2\lambda} \left( K x^\beta \Gamma(1 + \beta) + L t^\alpha \Gamma(1 + \alpha) \right) \right) \right), \]
\[ u_{121} (\xi) = a_0 + \frac{12K^2}{a A^2} \left( d^2 \lambda^2 + B \lambda + \frac{B^2}{4} - \frac{\Omega^2}{4} \tanh^2 \left( \frac{\sqrt{\Omega}}{2\lambda} \left( K x^\beta \Gamma(1 + \beta) + L t^\alpha \Gamma(1 + \alpha) \right) \right) \right), \]
where \( L = \frac{-K}{A^2} \left\{ 12K^2 d^2 \lambda^2 + 12K^2 Bd \lambda - 8K^2 E \lambda + a_0 a A^2 + K^2 B^2 \right\}. \)

Furthermore, to achieve exact solutions in terms of trigonometric functional form, substituting Eq. (19) into Eq. (18) together with Eq. (12), and applying conditions (i) \( C_1 = 0 \) but \( C_2 \neq 0 \), and (ii) \( C_2 = 0 \) but \( C_1 \neq 0 \), we attain the following solutions:

\[
\begin{align*}
    u_{21}(\xi) &= a_0 + \frac{12K^2}{a A^2} \left\{ d^2 \lambda^2 + Bd \lambda + \frac{B^2}{4} + \frac{\Omega}{4} \cot^2 \left( \frac{\sqrt{\lambda}}{2 \lambda} \xi \right) \right\}, \\
    u_{22}(\xi) &= a_0 + \frac{12K^2}{a A^2} \left\{ d^2 \lambda^2 + Bd \lambda + \frac{B^2}{4} + \frac{\Omega}{4} \tan^2 \left( \frac{\sqrt{\lambda}}{2 \lambda} \xi \right) \right\},
\end{align*}
\]

where \( \xi = \frac{K x^\beta}{\Gamma(1 + \beta)} + \frac{Lt^\alpha}{\Gamma(1 + \alpha)} \), \( L = \frac{-K}{A^2} \left\{ 12K^2 d^2 \lambda^2 + 12K^2 Bd \lambda - 8K^2 E \lambda + a_0 a A^2 + K^2 B^2 \right\}. \)

Making use of the complex variable \( \xi \), the solitary wave solutions turn into the following forms:

\[
\begin{align*}
    u_{21}(x,t) &= a_0 + \frac{12K^2}{a A^2} \left\{ d^2 \lambda^2 + Bd \lambda + \frac{B^2}{4} + \frac{\Omega}{4} \cot \left( \frac{\sqrt{\lambda}}{2 \lambda} \xi \right) \right\}, \\
    u_{22}(x,t) &= a_0 + \frac{12K^2}{a A^2} \left\{ d^2 \lambda^2 + Bd \lambda + \frac{B^2}{4} + \frac{\Omega}{4} \tan \left( \frac{\sqrt{\lambda}}{2 \lambda} \xi \right) \right\},
\end{align*}
\]

where \( \xi = \frac{K x^\beta}{\Gamma(1 + \beta)} + \frac{Lt^\alpha}{\Gamma(1 + \alpha)} \), \( L = \frac{-K}{A^2} \left\{ 12K^2 d^2 \lambda^2 + 12K^2 Bd \lambda - 8K^2 E \lambda + a_0 a A^2 + K^2 B^2 \right\}. \)

Taking into account Eq. (19) together with Eq. (13) into Eq. (18) and after simplifying the wave solutions become:

\[
\begin{align*}
    u_{31}(\xi) &= a_0 + \frac{12K^2}{a A^2} \left\{ d^2 \lambda^2 + Bd \lambda + \frac{B^2}{4} - \left( \frac{C_1}{C_1 + C_2} \right)^2 \left( C_1 \lambda \right) \right\}, \\
    u_{32}(\xi) &= a_0 + \frac{12K^2}{a A^2} \left\{ d^2 \lambda^2 + Bd \lambda + \frac{B^2}{4} - \left( \frac{C_2}{C_1 + C_2} \right)^2 \left( C_1 \lambda \right) \right\},
\end{align*}
\]

where \( \xi = \frac{K x^\beta}{\Gamma(1 + \beta)} + \frac{Lt^\alpha}{\Gamma(1 + \alpha)} \), \( L = \frac{-K}{A^2} \left\{ 12K^2 d^2 \lambda^2 + 12K^2 Bd \lambda - 8K^2 E \lambda + a_0 a A^2 + K^2 B^2 \right\}. \)

Setting up Eq. (19) together with Eq. (14) into Eq. (18) (if \( C_1 = 0 \) but \( C_2 \neq 0 \), and \( C_2 = 0 \) but \( C_1 \neq 0 \)) and after simplifying, the wave solutions become:

\[
\begin{align*}
    u_{41}(\xi) &= a_0 + \frac{12K^2}{a A^2} \left\{ d^2 \lambda^2 - \Delta \coth^2 \left( \frac{\sqrt{\lambda}}{\lambda} \xi \right) \right\}, \\
    u_{42}(\xi) &= a_0 + \frac{12K^2}{a A^2} \left\{ d^2 \lambda^2 - \Delta \tanh^2 \left( \frac{\sqrt{\lambda}}{\lambda} \xi \right) \right\},
\end{align*}
\]

where \( \xi = \frac{K x^\beta}{\Gamma(1 + \beta)} + \frac{Lt^\alpha}{\Gamma(1 + \alpha)} \).

\[
\begin{align*}
    u_{41}(x,t) &= a_0 + \frac{12K^2}{a A^2} \left\{ d^2 \lambda^2 - \Delta \coth^2 \left( \frac{\sqrt{\lambda}}{\lambda} \xi \right) \right\}, \\
    u_{42}(x,t) &= a_0 + \frac{12K^2}{a A^2} \left\{ d^2 \lambda^2 - \Delta \tanh^2 \left( \frac{\sqrt{\lambda}}{\lambda} \xi \right) \right\},
\end{align*}
\]
$u_{421}(x,t) = a_0 + \frac{12K^2}{aA^2} \left\{ d^2\lambda^2 - \Delta \tanh^2 \left( \frac{\sqrt{\Delta}}{\lambda} \left( \frac{Kx^\theta}{\Gamma(1+\beta)} + \frac{Lt^\theta}{\Gamma(1+\alpha)} \right) \right) \right\}$,

where $L = \frac{-K}{A^2} \{12K^2d^2\lambda^2 + 12K^2Bd\lambda - 8K^2E\lambda + a_0aA^2 + K^2B^2\}$.

According to the substitution of Eq. (19) together with Eq. (15) into Eq. (18) (if $C_1 = 0$ but $C_2 \neq 0$, and $C_2 = 0$ but $C_1 \neq 0$) and after simplifying, the wave solutions become:

$$u_{51}(\xi) = a_0 + \frac{12K^2}{aA^2} \left\{ d^2\lambda^2 + \Delta \cot^2 \left( \frac{i\sqrt{\Delta}}{\lambda} \xi \right) \right\},$$

$$u_{52}(\xi) = a_0 + \frac{12K^2}{aA^2} \left\{ d^2\lambda^2 + \Delta \tanh^2 \left( \frac{i\sqrt{\Delta}}{\lambda} \xi \right) \right\},$$

where $\xi = \frac{Kx^\theta}{\Gamma(1+\beta)} + \frac{Lt^\theta}{\Gamma(1+\alpha)}$.

$$u_{511}(x,t) = a_0 + \frac{12K^2}{aA^2} \left\{ d^2\lambda^2 + \Delta \cot^2 \left( \frac{i\sqrt{\Delta}}{\lambda} \xi \right) \right\},$$

$$u_{521}(x,t) = a_0 + \frac{12K^2}{aA^2} \left\{ d^2\lambda^2 + \Delta \tanh^2 \left( \frac{i\sqrt{\Delta}}{\lambda} \xi \right) \right\},$$

where $L = \frac{-K}{A^2} \{12K^2d^2\lambda^2 + 12K^2Bd\lambda - 8K^2E\lambda + a_0aA^2 + K^2B^2\}$.

Applying Eq. (20) into Eq. (18) together with Eq. (11) to Eq. (15), respectively, we have the following simplified form various classical traveling wave solutions which have numerous significant applications:

$$u_{61}(\xi) = a_0 + b_1 \left[ d + \frac{B}{2\lambda} + \frac{\sqrt{\Omega}}{2\lambda} \frac{C_1 \sinh \left( \frac{\sqrt{\Omega}}{2\lambda} \xi \right) + C_2 \cosh \left( \frac{\sqrt{\Omega}}{2\lambda} \xi \right)}{C_1 \cosh \left( \frac{\sqrt{\Omega}}{2\lambda} \xi \right) + C_2 \sinh \left( \frac{\sqrt{\Omega}}{2\lambda} \xi \right)} \right]^{-1},$$

$$u_{71}(\xi) = a_0 + b_1 \left[ d + \left( \frac{G'}{G} \right) \right]^{-1} + b_2 \left[ d + \left( \frac{G'}{G} \right) \right]^{-2},$$

where $\left( \frac{G'}{G} \right) = \frac{B}{2\lambda} + \frac{\sqrt{-\Omega}}{2\lambda} \frac{-C_1 \sin \left( \frac{\sqrt{-\Omega}}{2\lambda} \xi \right) + C_2 \cos \left( \frac{\sqrt{-\Omega}}{2\lambda} \xi \right)}{C_1 \cos \left( \frac{\sqrt{-\Omega}}{2\lambda} \xi \right) + C_2 \sin \left( \frac{\sqrt{-\Omega}}{2\lambda} \xi \right)}$.

$$u_{81}(\xi) = a_0 + b_1 \left[ d + \frac{B}{2\lambda} + \frac{C_2}{C_1 + C_2 \xi} \right]^{-1} + b_2 \left[ d + \frac{B}{2\lambda} + \frac{C_2}{C_1 + C_2 \xi} \right]^{-2},$$
\[
\begin{align*}
\mathcal{U}_9 (\xi) &= a_0 + b_1 \left[ d + \sqrt{\Delta} \left( \frac{C_1 \sinh \left( \frac{\sqrt{\Delta}}{\lambda} \xi \right)}{C_1 \cosh \left( \frac{\sqrt{\Delta}}{\lambda} \xi \right)} + C_2 \cosh \left( \frac{\sqrt{\Delta}}{\lambda} \xi \right) \right) \right]^{-1} \\
&+ b_2 \left[ d + \sqrt{\Delta} \left( \frac{C_1 \sinh \left( \frac{\sqrt{\Delta}}{\lambda} \xi \right)}{C_1 \cosh \left( \frac{\sqrt{\Delta}}{\lambda} \xi \right)} + C_2 \cosh \left( \frac{\sqrt{\Delta}}{\lambda} \xi \right) \right) \right]^{-2},
\end{align*}
\]

where
\[
\xi = \frac{K x^\alpha}{\Gamma (1 + \beta)} + \frac{Lt^\alpha}{\Gamma (1 + \alpha)},
\]

\[
L = \frac{K}{A^2} \left( 12 K^2 d^2 (A - C)^2 + 12 K^2 B d (A - C) - 8 K^2 E (A - C) + a_0 a_1 + K^2 B^2 \right),
\]

\[
b_1 = \frac{12 K^2}{a A^2} \left( 2 d (A - C)^2 + 3 d^2 B (A - C) - 2 d E (A - C) + B^2 - BE \right),
\]

\[
b_2 = \frac{-12 K^2}{a A^2} \left( d^2 (A - C)^2 + 2 d^2 B (A - C) - 2 d^2 E (A - C) + d^2 B^2 - 2 dB E + E^2 \right).
\]

Now making use of the complex variable \( \xi \), the above classical solitary wave solutions turn into the following form:

If \( C_2 = 0, C_1 \neq 0 \):
\[
\begin{align*}
\mathcal{U}_{6,1} (x,t) &= a_0 + b_1 \left[ d + B \frac{\sqrt{\Omega}}{2 \lambda} + \frac{\sqrt{\Omega} \tanh \frac{\sqrt{\Omega}}{2 \lambda}}{2 \lambda} \left( \frac{K x^\alpha}{\Gamma (1 + \beta)} + \frac{Lt^\alpha}{\Gamma (1 + \alpha)} \right) \right]^{-1} \\
&+ b_2 \left[ d + B \frac{\sqrt{\Omega}}{2 \lambda} + \frac{\sqrt{\Omega} \tanh \frac{\sqrt{\Omega}}{2 \lambda}}{2 \lambda} \left( \frac{K x^\alpha}{\Gamma (1 + \beta)} + \frac{Lt^\alpha}{\Gamma (1 + \alpha)} \right) \right]^{-2},
\end{align*}
\]

Now considering \( C_1 = 0, C_2 \neq 0 \), we have the following form:
\[
\begin{align*}
\mathcal{U}_{6,2} (x,t) &= a_0 + b_1 \left[ d + B \frac{\sqrt{\Omega}}{2 \lambda} + \frac{\sqrt{\Omega} e^{\frac{\sqrt{\Omega}}{2 \lambda} \left( \frac{K x^\alpha}{\Gamma (1 + \beta)} + \frac{Lt^\alpha}{\Gamma (1 + \alpha)} \right)}}{2 \lambda} + e^{\frac{\sqrt{\Omega}}{2 \lambda} \left( \frac{K x^\alpha}{\Gamma (1 + \beta)} + \frac{Lt^\alpha}{\Gamma (1 + \alpha)} \right)} \right]^{-1} \\
&+ b_2 \left[ d + B \frac{\sqrt{\Omega}}{2 \lambda} + \frac{\sqrt{\Omega} e^{-\frac{\sqrt{\Omega}}{2 \lambda} \left( \frac{K x^\alpha}{\Gamma (1 + \beta)} + \frac{Lt^\alpha}{\Gamma (1 + \alpha)} \right)}}{2 \lambda} - e^{-\frac{\sqrt{\Omega}}{2 \lambda} \left( \frac{K x^\alpha}{\Gamma (1 + \beta)} + \frac{Lt^\alpha}{\Gamma (1 + \alpha)} \right)} \right]^{-2},
\end{align*}
\]

If \( C_2 = 0, C_1 \neq 0 \):
A Comparative Study of Space and Time Fractional KdV Equation through Analytical Approach with Nonlinear Auxiliary Equation

\[ u_{711}(x,t) = a_0 + b_1 \left[ d + \frac{B}{2\lambda} + \frac{i\sqrt{\Omega}}{2\lambda} \right] \left\{ \frac{i\sqrt{\Omega} K x^\beta + L t^\alpha}{2\lambda \Gamma(1+\beta) + \Gamma(1+\alpha)} \right\}^{-1} \]

\[ + b_2 \left[ d + \frac{B}{2\lambda} - \frac{i\sqrt{\Omega}}{2\lambda} \right] \left\{ \frac{i\sqrt{\Omega} K x^\beta - L t^\alpha}{2\lambda \Gamma(1+\beta) + \Gamma(1+\alpha)} \right\}^{-2} \]

Now considering \( C_1 = 0, \ C_2 \neq 0 \), we have

\[ u_{712}(x,t) = a_0 + b_1 \left[ d + \frac{B}{2\lambda} + \frac{i\sqrt{\Omega}}{2\lambda} \cot \left\{ \frac{i\sqrt{\Omega} K x^\beta + L t^\alpha}{2\lambda \Gamma(1+\beta) + \Gamma(1+\alpha)} \right\} \right]^{-1} \]

\[ + b_2 \left[ d + \frac{B}{2\lambda} - \frac{i\sqrt{\Omega}}{2\lambda} \cot \left\{ \frac{i\sqrt{\Omega} K x^\beta - L t^\alpha}{2\lambda \Gamma(1+\beta) + \Gamma(1+\alpha)} \right\} \right]^{-2} \]

\[ u_{811}(x,t) = a_0 + b_1 \left[ d + \frac{B}{2\lambda} + \frac{C_2}{C_1 + C_2} \left\{ \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right\} \right]^{-1} \]

\[ + b_2 \left[ d + \frac{B}{2\lambda} + \frac{C_2}{C_1 + C_2} \left\{ \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right\} \right]^{-2} \]

If \( C_2 = 0, \ C_1 \neq 0 \), we have

\[ u_{911}(x,t) = a_0 + b_1 \left[ d + \sqrt{\frac{E}{A-C}} \tanh \left\{ \sqrt{\frac{E}{A-C}} \left\{ \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right\} \right\} \right]^{-1} \]

\[ + b_2 \left[ d + \sqrt{\frac{E}{A-C}} \tanh \left\{ \sqrt{\frac{E}{A-C}} \left\{ \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right\} \right\} \right]^{-2} \]

\( C_1 = 0, \ C_2 \neq 0 \),
If $C_2 = 0$, $C_1 \neq 0$, we have

$$u_{10_{11}}(x,t) = a_0 + b_1 \left[ d - \frac{i\sqrt{\Delta}}{\lambda} \tan \left( \frac{i\sqrt{\Delta}}{\lambda} \left( \Gamma(1 + \beta) + \frac{L \tau^\alpha}{\Gamma(1 + \alpha)} \right) \right) \right]^{-1}$$

$$+ b_2 \left[ d - \frac{i\sqrt{\Delta}}{\lambda} \tan \left( \frac{i\sqrt{\Delta}}{\lambda} \left( \frac{K x^\beta}{\Gamma(1 + \beta)} + \frac{L \tau^\alpha}{\Gamma(1 + \alpha)} \right) \right) \right]^{-2},$$

$C_1 = 0$, $C_2 \neq 0$

$$u_{10_{12}}(x,t) = a_0 + b_1 \left[ d + \sum_{n=0}^{\infty} (2n+1) \right]^{-1} + b_2 \left[ d + \sum_{n=0}^{\infty} (2n+1) \right]^{-2},$$

where

$$L = \frac{-K}{A^2} \left\{ 12K^2 d^2 \left( A - C \right)^2 + 12K^2 B \left( A - C \right) - 8K^2 E \left( A - C \right) + a_a d^2 + K^2 B^2 \right\}$$

$$b_1 = \frac{12K^2}{aA^2} \left\{ 2d^2 \left( A - C \right)^2 + 3d^2 B \left( A - C \right) - 2dE \left( A - C \right) + dB - BE \right\},$$

$$b_2 = \frac{-12K^2}{aA^2} \left\{ d^2 \left( A - C \right)^2 + 2d^2 B \left( A - C \right) - d^2 E \left( A - C \right) + d^2 B^2 - 2dB + E^2 \right\}.$$
A Comparative Study of Space and Time Fractional KdV Equation through Analytical Approach with Nonlinear Auxiliary Equation

\begin{align*}
\Delta = & \left[ \frac{C_1 \sinh \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right) + C_2 \cosh \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right)}{C_1 \cosh \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right) + C_2 \sinh \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right)} \right]^2 + \frac{2\lambda^2 E^2 + \lambda E B^2}{2\Delta} \left[ \frac{C_1 \sinh \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right) + C_2 \cosh \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right)}{C_1 \cosh \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right) + C_2 \sinh \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right)} \right]^2,
\end{align*}

\begin{align*}
\Delta = & \left[ \frac{-C_1 \sinh \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right) + C_2 \cos \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right)}{C_1 \cos \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right) + C_2 \sin \left( \frac{\sqrt{\Delta} \xi}{2\lambda} \right)} \right]^2 + \frac{\lambda^2 (2\lambda E^2 + E B^2)}{\Delta} \left[ \frac{-C_1 \sinh \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right) + C_2 \cos \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right)}{C_1 \cos \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right) + C_2 \sin \left( \frac{\sqrt{\Delta} \xi}{2\lambda} \right)} \right]^2,
\end{align*}

Complex Forms:

If \( C_2 = 0, C_1 \neq 0 \), we have

\begin{align*}
\Delta = & \left[ \frac{\sin \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right) + \cos \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right)}{\sin \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right) + \cos \left( \frac{\sqrt{\Delta} \xi}{\lambda} \right)} \right]^2 + \frac{8\lambda (2\lambda E^2 + E B^2)}{O^2} \left[ \frac{-p^3 + 2p^5 - 17p^7 + \ldots}{3 - 15} \right]^2,
\end{align*}

where \( p = \sqrt{\Omega} \left( \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right) \), and \( L = -\frac{K}{\lambda^2} \left( aa_0 A^2 - 2K^2 B^2 - 8K^2 E (A - C) \right) \).

Now considering \( C_1 = 0, C_2 \neq 0 \), we have the solutions having the following form:

\begin{align*}
\Delta = & \left[ \frac{e^p + e^{-p}}{e^p - e^{-p}} \right]^2 + \left[ \frac{e^p - e^{-p}}{e^p + e^{-p}} \right]^2,
\end{align*}

where \( p = \sqrt{\Omega} \left( \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right) \), and \( L = -\frac{K}{\lambda^2} \left( aa_0 A^2 - 2K^2 B^2 - 8K^2 E (A - C) \right) \).

If \( C_2 = 0, C_1 \neq 0 \):

\begin{align*}
\Delta = & \left[ \frac{e^p + e^{-p}}{e^p - e^{-p}} \right]^2 + \left[ \frac{e^p - e^{-p}}{e^p + e^{-p}} \right]^2,
\end{align*}

Now considering \( C_1 = 0, C_2 \neq 0 \), we have the following solutions:

\begin{align*}
\Delta = & \left[ \frac{e^p + e^{-p}}{e^p - e^{-p}} \right]^2 + \left[ \frac{e^p - e^{-p}}{e^p + e^{-p}} \right]^2,
\end{align*}

Now considering \( C_1 = 0, C_2 \neq 0 \), we have the following solutions:
\[ u_{8,1}(x,t) = a_0 + b_1 \left[ d + \frac{B}{2\lambda} + \frac{C_2}{C_1 + C_2 \left( \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right)} \right]^{-1} + b_2 \left[ d + \frac{B}{2\lambda} + \frac{C_2}{C_1 + C_2 \left( \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right)} \right]^{-2}, \]

If \( C_2 = 0, C_1 \neq 0 \):

\[ u_{9,1}(x,t) = a_0 + b_1 \left[ d + \sqrt{E} \tanh \left( \frac{E}{A-C} \left( \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right) \right) \right]^{-1} + b_2 \left[ d + \sqrt{E} \tanh \left( \frac{E}{A-C} \left( \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right) \right) \right]^{-2}, \]

\[ C_1 = 0, C_2 \neq 0 \]

\[ u_{9,12}(x,t) = a_0 + b_1 \left[ d + \sqrt{E} \tanh \left[ \frac{E}{A-C} \left( \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right) \right] \right]^{-1} + b_2 \left[ d + \sqrt{E} \tanh \left[ \frac{E}{A-C} \left( \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right) \right] \right]^{-2}, \]

If \( C_2 = 0, C_1 \neq 0 \), we have

\[ u_{10,1}(x,t) = a_0 + b_1 \left[ d - \frac{i \sqrt{\Delta}}{\lambda} \tan \left( \frac{i \sqrt{\Delta}}{\lambda} \left( \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right) \right) \right]^{-1} + b_2 \left[ d - \frac{i \sqrt{\Delta}}{\lambda} \tan \left( \frac{i \sqrt{\Delta}}{\lambda} \left( \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right) \right) \right]^{-2}, \]

If \( C_1 = 0, C_2 \neq 0 \), we have

\[ u_{10,2}(x,t) = a_0 + b_1 \left[ d + \sum_{n=0}^{\infty} \frac{(2n+1)}{\left( \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right)^2} \right]^{-1} + b_2 \left[ d + \sum_{n=0}^{\infty} \frac{(2n+1)}{\left( \frac{K x^\beta}{\Gamma(1+\beta)} + \frac{L t^\alpha}{\Gamma(1+\alpha)} \right)^2} \right]^{-2}, \]
where

\[ L = \frac{-K}{A^2} \left\{ 12K^2d^2(A-C)^2 + 12K^2Bd(A-C) - 8K^2E(A-C) + a_0aA^2 + K^2B^2 \right\} \]

\[ b_1 = \frac{12K^2}{aA^2} \left\{ 2d^3(A-C)^2 + 3d^2B(A-C) - 2dE(A-C) + dB^2 - BE \right\} , \]

\[ b_2 = \frac{-12K^2}{aA^2} \left\{ d^4(A-C)^2 + 2d^3B(A-C) - 2d^2E(A-C) + d^2B^2 - 2dB^2 + E^2 \right\} . \]

It is important to note that the obtained solutions \( u_{1,1}(x,t) \) to \( u_{10,12}(x,t) \) of the fractional KdV equation with many arbitrary parameters are resourceful and most of those were not found in the earlier literature. The differential equation involving derivatives of non-integer orders can be suitable models for several complex physical phenomena, for this purpose the renowned FKdV equation was investigated. And these solutions might be implemented for solid state physics, electromagnetic interactions, electrodynamics, and quantum relativistic etc.

4. Results and Discussion

It is very crucial to mentioning that some of the newly constructed solutions disclose excellent similarity subject to particular values of arbitrary parameters with solutions those are already available in the earlier literature. A comparison between Gepreel and Omran’s [37] solutions and our obtained solutions has been presented in the following table.

<table>
<thead>
<tr>
<th></th>
<th>Gepreel and Omran’s solutions [37]</th>
<th>Our obtained solutions in this research</th>

<tbody>
<tr>
<td>1. When ( \lambda^2 - 4\mu &gt; 0, B = 0 ), the solution is ( u(\xi) = a_0 + \frac{3K^2\lambda^2}{a} - \frac{3K^2(\lambda^2 - 4\mu)}{a} \coth^2 \left( \frac{(\lambda^2 - 4\mu)}{2} \xi \right) )</td>
<td>1. When ( A = 1, B = -\lambda, C = 0, E = -\mu, B \neq 0, \lambda = A - C ), ( \Omega = B^2 + 4E(A - C) &gt; 0 ), the solution ( u_{1,1}(\xi) = a_0 + \frac{12K^2}{aA^2} \left( d^2\lambda^2 + B\lambda + \frac{B^2}{4} - \frac{\Omega}{4} \coth^2 \left( \frac{\sqrt{\Omega}}{2\lambda} \xi \right) \right) )</td>
<td></td>
</tr>
<tr>
<td>2. When ( \lambda^2 - 4\mu &lt; 0, B = 0 ) the solution is ( u(\xi) = a_0 + \frac{3K^2\lambda^2}{a} - \frac{3K^2(4\mu - \lambda^2)}{a} \tan^2 \left( \frac{(4\mu - \lambda^2)}{2} \xi \right) )</td>
<td>2. When ( A = 1, B = -\lambda, C = 0, E = -\mu, B \neq 0, \lambda = A - C ), ( \Omega = B^2 + 4E(A - C) &lt; 0 ), the solution ( u_{2,1}(\xi) = a_0 + \frac{12K^2}{aA^2} \left( d^2\lambda^2 + B\lambda + \frac{B^2}{4} + \frac{\Omega}{4} \tan^2 \left( \frac{\sqrt{\Omega}}{2\lambda} \xi \right) \right) )</td>
<td></td>
</tr>
<tr>
<td>3. When ( \lambda^2 - 4\mu &gt; 0, A = 0 ), the solution is ( u(\xi) = a_0 + \frac{3K^2\lambda^2}{a} - \frac{3K^2(\lambda^2 - 4\mu)}{a} \tanh^2 \left( \frac{(\lambda^2 - 4\mu)}{2} \xi \right) )</td>
<td>3. When ( A = 1, B = -\lambda, C = 0, E = -\mu, B \neq 0, \lambda = A - C ), ( \Omega = B^2 + 4E(A - C) &gt; 0 ), the solution ( u_{1,1}(\xi) = a_0 + \frac{12K^2}{aA^2} \left( d^2\lambda^2 + B\lambda + \frac{B^2}{4} - \frac{\Omega}{4} \tanh^2 \left( \frac{\sqrt{\Omega}}{2\lambda} \xi \right) \right) )</td>
<td></td>
</tr>
</tbody>
</table>

Beside these solutions, we obtained many new exact wave solutions from \( u_{4,1}(x,t) \) to \( u_{10,12}(x,t) \) in this work, and those were not being reported in the literature earlier. The produced solutions can become special function if the arbitrary constants take specific values.
5. Conclusions

In this research, the nonlinear fractional complex transformation has been implemented to convert a certain fractional partial differential equations into another ODEs of integer order. The results are presented by a polynomial in \((G'/G)\), where \((G'/G)\) satisfies the second order nonlinear ODE as \(AGG'' - BGG' - C(G')^2 - EG^2 = 0\). We have examined the space and time fractional nonlinear KdV equation. As a result, we have produced new and further general solitary wave solutions such as single soliton, double solitons, kink type solutions, periodic solutions in terms of various hyperbolic forms, several trigonometric forms, rational forms etc., having many arbitrary parameters, which may have remarkable applications in applied mathematics and biological sciences. The new generalized \((G'/G)\) method has its own advantage: direct, simple, succinct and can be executed for many other fractional nonlinear equations.
